| Symbol | "Think" | Value of $L^\dagger$ | Formal Meaning$^\ddagger$ |
|---|---|---|---|
| $\mathbf{o}$ | "$<$" | $L = 0$ | $f(n) = \mathrm{O}(g(n))$ but not $f(n) = \Omega(g(n))$ |
| $\mathbf{O}$ | "$\leq$" | $L < \infty$ | $\exists c, n_0[\forall n \geq n_0[f(n) \leq cg(n)]]$ |
| $\mathbf{\Omega}$ | "$\geq$" | $L > 0$ | $\exists c, n_0[c \neq 0 \ \& \ \forall n \geq n_0[f(n) \geq cg(n)]]$ |
| $\mathbf{\Theta}$ | "$=$". | $0 < L < \infty$ | $f(n) = \mathrm{O}(g(n))$ and also $f(n) = \Omega(g(n))$ |

† Value of $L = \lim_{n\to\infty} f(n)/g(n)$ *when it exists.*

‡ Formal meaning of $f(n) = \_(g(n))$.

Figure 1: Greek Notation

## Asymptotic Formulæ

$f(n) = o(g(n))$

**Casual:** $f$ is *strictly* smaller (faster) than $g$.

**Definition:** $f(n) = O(g(n))$ but not $f(n) = \Omega(g(n))$

**Calculus:** $\lim_{n\to\infty} f(n)/g(n) = 0$

$f(n) = O(g(n))$

**Casual:** $f$ is smaller (faster) than or equal to $g$.

**Informal:** $f$ is eventually smaller than $g$ (up to a constant).

**Definition:** $\exists c, n_0$ *such that* $\forall n \geq n_0 \quad f(n) \leq cg(n)$

**Calculus:** $\lim_{n\to\infty} f(n)/g(n) < \infty$

$f(n) = \Omega(g(n))$

**Casual:** $f$ is greater (slower) than or equal to $g$.

**Informal:** $f$ is eventually greater than $g$ (up to a constant).

**Definition:** $\exists c \neq 0, n_0$ *such that* $\forall n \geq n_0 \quad f(n) \geq cg(n)$

**Calculus:** $\lim_{n\to\infty} f(n)/g(n) > 0$

$f(n) = \Theta(g(n))$

**Casual:** $f$ is approximately the same as $g$.

**Definition:** $\exists c_1 \neq 0, c_2, n_0$ *such that* $\forall n \geq n_0 \quad c_1 g(n) \leq f(n) \leq c_2 g(n)$

**Calculus:** $\lim_{n\to\infty} f(n)/g(n) \in (0, \infty)$

**Usage** the symbols O, o, $\Omega$, and $\Theta$ are *not* function symbols. They should only be used "at the top level" on the right hand side of an equation. Always use parentheses with these functions.

## Generic $\Theta(f(n))$ formulæ.

- If $f(n) = c \cdot g(n)$ then $f(n) = \Theta(g(n))$. *Constants don't matter.*
- If $f(n) = a_0 + a_1 n + a_2 n^2 + \cdots + a_{k-1} n^{k-1} + a_k n^k$, where $a_k \neq 0$, then $f(n) = \Theta(n^k)$. *Don't sweat the small stuff (polynomials).*
- If $g(n) = \mathrm{o}(f(n))$ then $f(n) + g(n) = \Theta(f(n))$. *Don't sweat the small stuff (general).*
- $f(n) + g(n) = \Theta(\max(f(n), g(n))$. [This one comes up over and over in algorithm analysis.]
- If $f(n) = \Theta((\log n))$ and $g(n) = \Theta(n^\epsilon)$ (where $\epsilon > 0$) then $f(n) = \mathrm{o}(g(n))$. *Logarithms are smaller than polynomials.*
- If $f(n) = \Theta(n^k)$ and $g(n) = \Theta(c^n)$ (where $c > 1$) then $f(n) = \mathrm{o}(g(n))$. *Polynomials are smaller than exponential functions.*

## Logarithms.

- If $f(n) \to +\infty$ and $g(n) \to +\infty$ and $f(n) = \Theta(g(n))$ then $\log f(n) = \Theta(\log g(n))$. (*N.B. the converse does not hold!*) *logs preserve* $\Theta$.
- [Charlie's Rule] If $f(n) \to +\infty$ and $g(n) \to +\infty$ and $\lim_{n\to\infty} \frac{\log f(n)}{\log g(n)} < 1$ then $f(n) = \mathrm{o}(g(n))$.[1] This rule helps a lot in dealing with odd functions like $n^{1/(\log\log n)}$.
- $\log_a n = \Theta(\log_b n)$. *The base doesn't matter.*

## Factorials.

**Stirling's formula** $n! = \sqrt{2\pi n}\left(\frac{n}{e}\right)^n \left(1 + \frac{1}{12\,n} + \frac{1}{288\,n^2} + g(n)\right)$
where $g(n) = \mathrm{o}(n^{-2})$.
Consequently $\log n! = \Theta(n \log n)$.

[1] I know about this nice result from Charlie Obimbo, who presented it at WCCCE '03.
