Symbol	"Think"	Value of $L^\dagger$	Formal Meaning‡
$\mathbf{o}$	"$<$"	$L = 0$	$f(n) = \mathrm{O}(g(n))$ but not $f(n) = \Omega(g(n))$
$\mathbf{O}$	"$\leq$"	$L < \infty$	$\exists c, n_0[\forall n \geq n_0[f(n) \leq cg(n)]]$
$\boldsymbol{\Omega}$	"$\geq$"	$L > 0$	$\exists c, n_0[c \neq 0 \;\&\; \forall n \geq n_0[f(n) \geq cg(n)]]$
$\boldsymbol{\Theta}$	"$=$".	$0 < L < \infty$	$f(n) = \mathrm{O}(g(n))$ and also $f(n) = \Omega(g(n))$

† Value of $L = \lim_{n\to\infty} f(n)/g(n)$ *when it exists.*

‡ Formal meaning of $f(n) = \_(g(n))$.

Figure 1: Greek Notation

Asymptotic Formulæ

$f(n) = \mathrm{o}(g(n))$ (**better** $f(n) \in \mathrm{o}(g(n))$)

> **Casual:** f is *strictly* smaller (faster) than g.
>
> **Definition:** $f(n) \in \mathrm{O}(g(n))$ but not $f(n) \in \Omega(g(n))$
>
> **Calculus:** $\lim_{n\to\infty} f(n)/g(n) = 0$

$f(n) = \mathrm{O}(g(n))$ (**better** $f(n) \in \mathrm{O}(g(n))$)

> **Casual:** f is smaller (faster) than or equal to g.
>
> **Informal:** f is eventually smaller than g (up to a constant).
>
> **Definition:** $\exists c, n_0$ *such that* $\forall n \geq n_0 \quad f(n) \leq cg(n)$
>
> **Calculus:** $\lim_{n\to\infty} f(n)/g(n) < \infty$

$f(n) = \Omega(g(n))$ (**better** $f(n) \in \Omega(g(n))$)

> **Casual:** f is greater (slower) than or equal to g.
>
> **Informal:** f is eventually greater than g (up to a constant).
>
> **Definition:** $\exists c \neq 0, n_0$ *such that* $\forall n \geq n_0 \quad f(n) \geq cg(n)$
>
> **Calculus:** $\lim_{n\to\infty} f(n)/g(n) > 0$

$f(n) = \Theta(g(n))$ (**better** $f(n) \in \Theta(g(n))$)

> **Casual:** f is approximately the same as g.
>
> **Definition:** $f(n) \in \mathrm{O}(g(n))$ and also $f(n) \in \Omega(g(n))$
>
> **Calculus:** $\lim_{n\to\infty} f(n)/g(n) \in (0, \infty)$

Usage the symbols O, o, Ω, and Θ are *not* function symbols. Formally $\Omega(h))$ is a class of functions. Used "old style" they should only be used "at the top level" on the right hand side of an equation. Always use parentheses after these synmbols.

Generic $\Theta(f(n))$ formulæ.

- If $f(n) = c \cdot g(n)$ then $f(n) \in \Theta(g(n))$. *Constants don't matter.*
- If $f(n) = a_0 + a_1 n + a_2 n^2 + \cdots + a_{k-1} n^{k-1} + a_k n^k$, where $a_k \neq 0$, then $f(n) \in \Theta(n^k)$. *Don't sweat the small stuff (polynomials).*
- If $g(n) \in \mathrm{o}(f(n))$ then $f(n) + g(n) \in \Theta(f(n))$. *Don't sweat the small stuff (general).*
- $f(n) + g(n) \in \Theta(\max(f(n), g(n))$. [This one comes up over and over in algorithm analysis.]
- If $f(n) \in \Theta((\log n))$ and $g(n) \in \Theta(n^\epsilon)$ (where $\epsilon > 0$) then $f(n) = \mathrm{o}(g(n))$. *Logarithms are smaller than polynomials.*
- If $f(n) \in \Theta(n^k)$ and $g(n) in \Theta(c^n)$, where $c > 1$, then $f(n) \in \mathrm{o}(g(n))$. *Polynomials are smaller than exponential functions.*

Logarithms.

- If $f(n) \to +\infty$ and $g(n) \to +\infty$ and $f(n) \in \Theta(g(n))$ then $\log f(n) \in \Theta(\log g(n))$. (*N.B. the converse does not hold!*) *logs preserve* Θ*.*
- [Charlie's Rule] If $f(n) \to +\infty$ and $g(n) \to +\infty$ and $\lim_{n\to\infty} \frac{\log f(n)}{\log g(n)} < 1$ then $f(n) \in \mathrm{o}(g(n))$.[1] This rule helps a lot in dealing with odd functions like $n^{1/(\log \log n)}$.
- $\log_a n \in \Theta(\log_b n)$. *The base doesn't matter.*

Factorials.

Stirling's formula $n! = \sqrt{2\pi n} \left(\frac{n}{e}\right)^n \left(1 + \frac{1}{12\,n} + \frac{1}{288\,n^2} + g(n)\right)$
where $g(n) = \mathrm{o}(n^{-2})$.
Consequently $\log n! = \Theta(n \log n)$.

[1] I know about this nice result from Charlie Obimbo, who presented it at WCCCE '03.
