

Functional and Logic Programming

Web-page: <https://web.unbc.ca/~casper/Semesters/2023-05F/370.php>

Moodle-page: <https://moodle.unbc.ca/>

Prerequisites: A grade of C⁻ or better in CPSC 141, and CPSC 281; or permission of instructor.

Instructor: David Casperson; **Office:** T&L 10-2050; **Phone:** 960-6672; **Departmental Assistant:** Meagan Jago ((250)960-5153); **e-mail:** David.Casperson@unbc.ca .

Accommodations: If there is any student in this course who, because of a disability, may have a need for special academic accommodations, please come and discuss this with me, or contact the Access Resource Centre located in Teaching & Learning 10-1048.

Grading Scheme and Dates:

Note that the mid-term exams are scheduled on Wednesdays.

Homework:	25%	
First class:		Wed, Sep 06
Midterm 1:	20%	2023-10-13
Midterm 2:	20%	2023-11-13
Last class:		Tue, Dec 05
Final Exam:	35%	

Grades for midterm II and the final are to be calculated as described in class.

Programming Assignments: There will be many small programming assignments during the semester. Programming languages include HASKELL and PROLOG.

Lecture times: MWF 10:30–11:20. **Room:** 5-176. There are *no* labs or tutorials.

Office Hours: Scheduled for:

MT 14:00-15:00

Please feel to interrupt me whenever you can find me, or schedule alternate times.

Text Books and References: There is no required textbook, but [2] is a great introduction to HASKELL freely available online. I assume that you have access to it.

Book [5] provides another good beginner reference, and also has a free web verions.

[1, 4] are PROLOG books in the UNBC library.

Students who successfully complete CPSC 370 will:

- appreciate the functional and logic programming paradigms;
- be cognizant of the associated theory and language implementation techniques (for instance, the λ -calculus, closures, unification, thunks, and so on),

and consequently will be stronger programmatic problem solvers in whatever programming environment they work.

Approximate Course Content:

GENERAL

- Characteristics of functional programming languages,
- Strict and lazy evaluation
- Pure and impure functions
- static versus lexical scoping
- Basic syntax.
- Mathematical concepts: Relations, Functions, partial functions, Cartesian products, Disjoint unions, "Currying", categories, monads, combinators
- Programming: recursion, tail recursion, tail recursion strategies, pure data structures.

HASKELL:

- Types, polymorphic types, type classes
- data structures.
- immutability and its consequences
- Laziness: its implementation consequences
- Semigroups and Monoids; Foldables and Traversable.
- Functors, Applicatives, and Monoids.
- Monads, do-notation, monadic programming.

PROLOG

- What logic programming is.
- Facts. Rules. Goals. Variables. Conjunctions. Horn Clauses.
- The Unification algorithm.
- Programming strategies: Accumulator arguments, difference lists.
- Cuts. Negation.
- Arithmetic.
